

Deoxycholic acid mechanism.

Deoxycholic acid induce lipolysis through double effects.

Deoxycholic acid is a bile acid which emulsifies and solubilizes dietary fats. It disrupts cell membranes in adipocytes and destroys fat cells in that tissue.

Deoxycholic acid

Deoxycholic acid breaks down the wall of the fat cell to decompose. These destroyed cells cause collagen production, which also has the effect of maintaining elasticity.

L-carnitine

L-carnitine is an amino acid and acts as an essential cofactor for fatty acid metabolism, helping to burn fats.

Vitamin B12

It promotes the use of fats, carbohydrates and proteins in the body, to help reduce fats.

Deoxycholic acid induce lipolysis through double effects.
